

Digital Onboarding Optimization

Executive Summary

This repository presents a fully synthetic Product Analytics and Lean Six Sigma case study. The business problem centers on friction during digital onboarding, specifically when users postpone identity document submission. The objective is to quantify the impact of this behavior and propose product improvements backed by data.

Methodology

- Synthetic dataset generation (100k users)
- Exploratory Data Analysis
- Product Funnel Analysis
- User Segmentation
- Statistical Hypothesis Testing
- A/B Test Design
- Financial Impact Simulation
- Interactive Dashboard

Key Findings

Area	Finding
Behavior	Immediate document upload is associated with substantially higher approval rates.
Operations	Users postponing verification generate more support demand.
Experiment	A/B testing is recommended before rollout.
Business	Improving onboarding increases approvals and reduces operating costs.
